The Noble Art

The Noble Art of Structural Analysis of Glycoproteins

During the last few years it has become apparent that the carbohydrate in glycoproteins is a key factor.

Glycoproteins like t-PA, EPO, factor VIII, interleukins and interferons will show a rapid sales growth in the pharmaceutical market.

Glycoproteins have been difficult to identify and thus hard to protect from plagiarism.

The unique Glycoprint Method, developed at BioCarb, has made it possible to identify the carbohydrate in new generations of glycoproteins.

The Glycoprint Method gives each glycoprotein a specific identity, which can be used when filing patents and when registering products.

The information obtained can also be of great value in explaining the different biological properties of glycoproteins and will be invaluable in further development.

Update yourself on the state-of-the-art in glycoproteins and the unique Glycoprint Method by using the Reader Service Card.
